

SocialNetwork latency: completed requests only

What the percentiles above leave out (bar labels = requests offered but never completed)

Top panel describes only requests that completed. Bottom bars = offered load minus completed (timed out, or never sent because the client could not reach the target rate) -- a low p99 over a tall bar is a step that mostly did not answer. Offered load = target RPS x step duration; wrk2's timeout counter counts socket events, not requests, and is not the basis of the flag.
